Assignment 1.
 Create three table
Employee(ecode,name),**Salary**(amount),**Designation**(designation),**Address**(state,city,country, pin,street,flr)create crud function and then display data with employee name,designation,salary,address with the halp of **ECODE** searching.

Assignment 2.
 Create **Country** and **Student** table then add country as static/dynamic in database then create a form fetch all country in dropdown and submit button,   select one country or multiple country then on submit button click insert data in Student with comma separated and display all Student with multiple country in sequence.

 As example
Table store data Student country_id id =1 [101,202,204,205]
                                  id =2 [202,101,204,206]
               select country 101
                 Show list
                       101
                       101

          Again select country 206, 205

                  show list 206
                          205
